

rotacaster™

a revolution in motion

- 360° movement
- direct tracking
- robust & durable
- simple mounting

Dogg's innovative use of the Rotacaster allows riders to perform stunts with confidence.

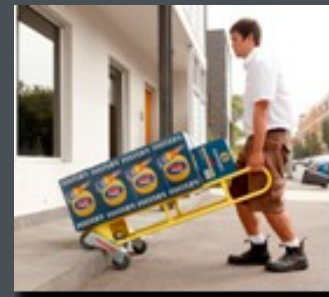

The rotacaster is a multi-directional wheel that provides the ability to move in any direction while mounted in a fixed direction, using rollers rather than a swivel mount.

Whilst multi-directional wheels are used throughout the world in conveyor applications, the rotacaster is the only one manufactured as a floor wheel, providing the sole alternative to the swivel castor.

Manufactured from engineering polymer, the injection moulded web like structure of the wheel body and the over-moulded rollers, provide a durable and robust wheel with no pins, inserts or seams making it ideal for tough environments.

The fixed orientation of the wheel facilitates both simple and stable mounting alternatives that are less prone to impact damage and allow the wheel to be housed within a product with minimal space or clearance requirements.

no swivel • no coupling • no detours

conveyors | handtrucks | dollies | trolleys
load skates | furniture and appliances | robotics
